SIAMEASE MOBILE

INTRODUCTION

SIAMEASE MOBILE is an extension of the Siamease Transaction Assistant, allowing easy mobile access to Siamease Tasks and Scripts in SAP.

The Siamease Transaction Assistant™ is primarily designed to help users with routine data capture from within the SAP system. Users are typically logged into SAPGUI and use Siamease to perform bulk capture into SAP transactions.

Siamease Mobile™ is designed for the user that does not typically use SAPGUI. The mobile interface allows easy capture of predefined fields that are then captured into SAP via the Siamease Transaction Assistant™.

The Siamease mobile frontend is highly compatible with a range of devices from Ipad, Blackberry, iPhone or Android. It is equally accessible via any browser on a PC or Mac.

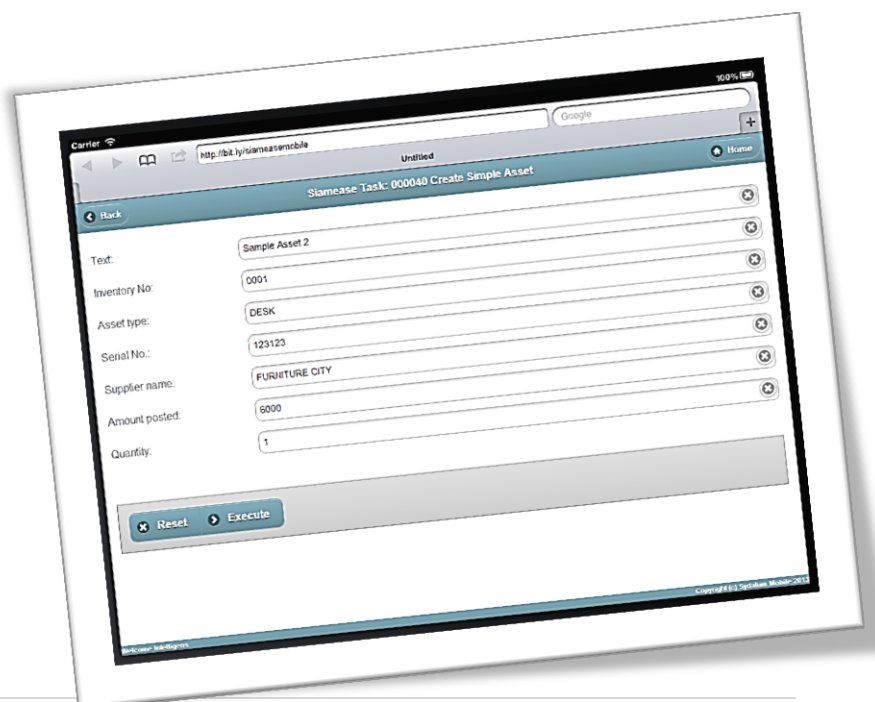

Best of all is that the mobile setup is practically hands free. Any Siamease task flagged for the Transaction Assistant is automatically available in the Mobile Frontend. New tasks recorded in Siamease automatically add to the mobile functionality whilst still ensuring that the user must have authorisation to execute the task. No further setup or development is required.

This document provides a quick sneak preview of Siamease Mobile™.

SIMPLE TRANSACTION CAPTURE FOR SAP

Siamease Mobile can be used to provide simple capture screens via mobile or tablet devices. Siamease automatically presents a view that is best fit for the device at hand.

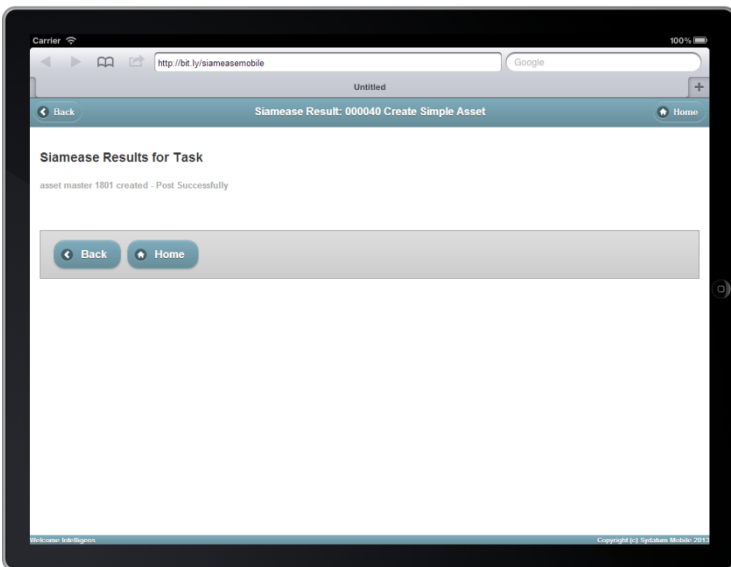

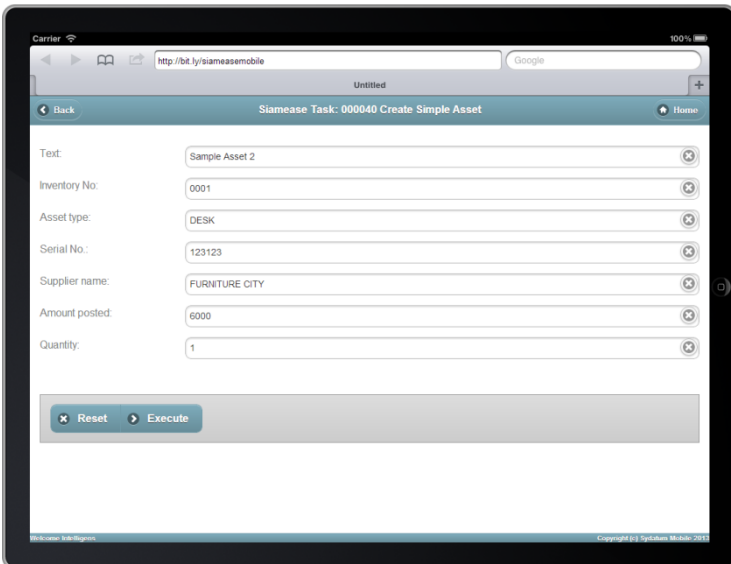

Tasks are grouped into application areas to make it easier for the user.

We see that there are 3 tasks available to the mobile device. In this example we will create a simple asset. Selecting a task will then display the required fields needed for that task.

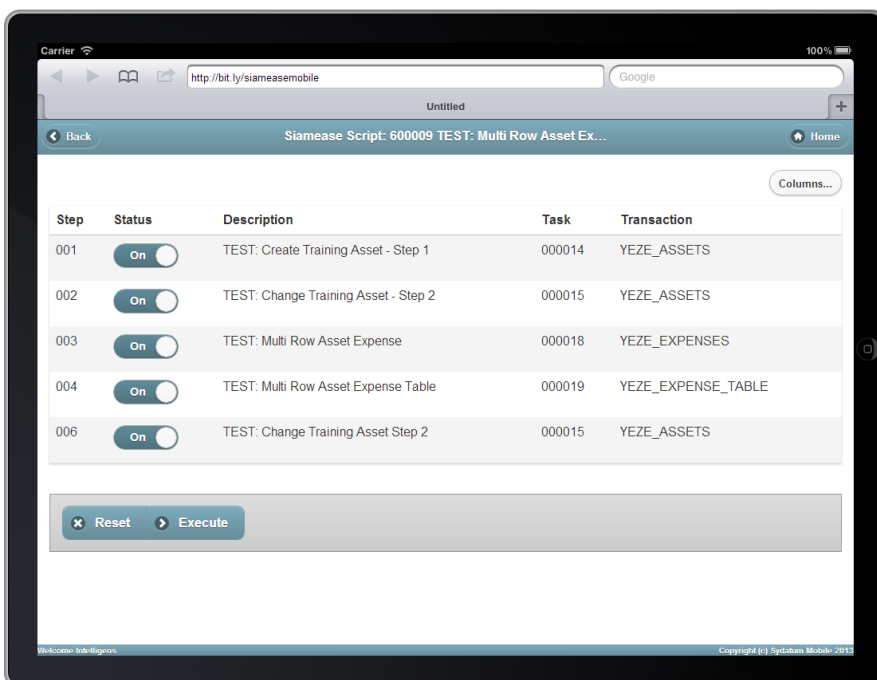

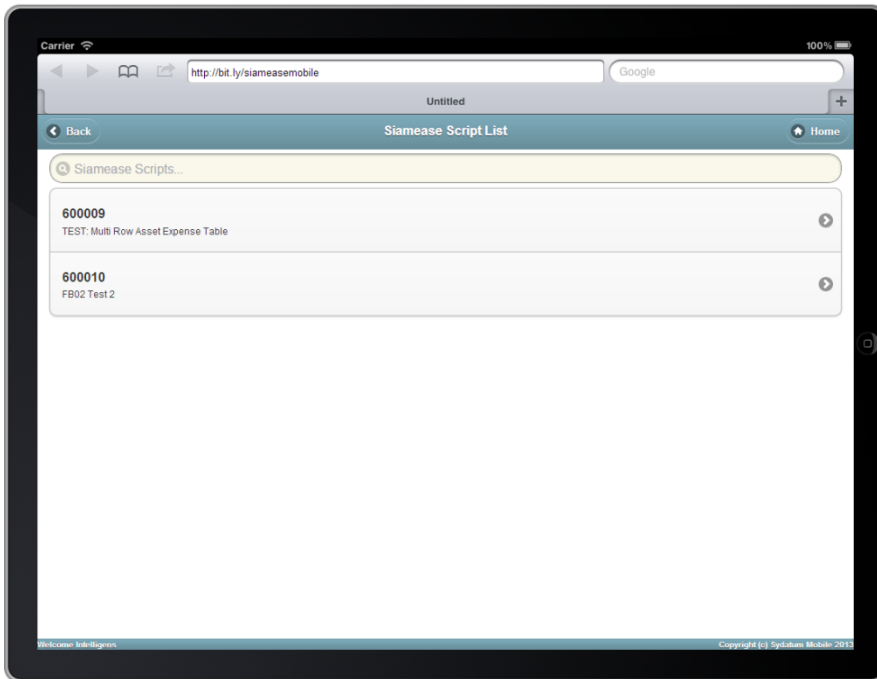

The fields are easily captured as the layout adjusts per the device.

SCRIPT MANAGEMENT

Siamease can be used for automated testing. A list of tasks can be executed via a Siamease Script. The script manages the scenario data supplied to the process as well as the audit trail or results generated from the process. Siamease Mobile™ can very easily present test scripts and execute the test. This is more of an example of what is possible with scripting rather than a real practical application.

From the Main menu we choose SCRIPTS.

Selecting the relevant test script will present a list of all the steps within the test. Each step can be deactivated by flicking the status switch off.

Executing the script will automate the capture process in SAP and present the results of the entire test run to the mobile frontend.

REPORTING

Siamease mobile comes equipped with web reporting. Standard Reports, Custom written Z reports and ABAP query can be executed by the Siamease Mobile Reporting Engine. Report names and Queries can be added to a configuration table making the report available to the mobile frontend.

The mobile frontend delivers simple selection screens and outputs basic data in reporting.

ABAP Query report

GRAPHS

In keeping with a bidirectional solution, Siamease offers graphic functionality.

CUSTOMIZING

Siamease Mobile has the ability to allow customers to add and specify their own corporate colours and logos to the frontend.
